JOB SUMMARY

The Regional Registered Nurse I assists who operates a nursing station in a remote and geographically isolated region of the province, or serves as a station relief nurse. May assist in giving specialized treatment or service that ordinarily is performed by a physician or dentist.

Key and Periodic Activities

— Serves as an assistant to the Regional Registered Nurse II or serves as a station relief nurse in a remote and isolated area of the Province in administering and coordinating medical service for area residents.
— Assists with and conducts clinics, makes diagnoses, prescribes and dispenses drugs.
— Assists with emergency medical treatment and refers or accompanies patients to hospitals.
— Visits homes to give medical service and instruct families in care of patients.
— Assists with maintenance of a healthy environment by instruction, inspection and recommendation for improvement.
— Assists with pre-natal and post-natal care and with deliveries of infants.
— Maintains all supplies and equipment for the efficient carrying out of required nursing services.
— Maintains clinical records of patients.

SKILL

Knowledge

General and Specific Knowledge:
— Clinical experiences in many nursing fields to service all age groups.
— Childhood and adult vaccinations
— Health promotion activities such as blood pressure and blood sugar screening
— Health maintenance activities for chronic conditions
— Assessment for home support services and placement at long term care facilities
— EKG completion and venipuncture, emergency care procedures relating to labour, cardiac arrest and many types of trauma.
— Patient diagnoses, assessment, and treatment
— Current knowledge of trends, research and developments within nursing and related field

**Formal Education and/or Certification(s):**
— Minimum: Undergraduate Degree in Nursing
— Registration with the Association of Registered Nurses of Newfoundland and Labrador (ARNNL)

**Years of Experience:**
— Minimum: 1 to 2 years

**Competencies:**
— Critical thinking, time management, and computer skills
— Operation of EKG machine, automatic defibrillator, Blood Glucose monitor, Oxygen regulators, Nebulizers, and weigh scale
— Performance of physical assessments on patients
— Ethical decision-making
— Communicate effectively

### Interpersonal Skills

— A range of interpersonal skills are used to listen to information and ask questions to collect patient history, communicate complex information, provide support, education, care, comfort, and nurturing to patients and/or their families, instruct/train/teach caregivers on patient care, make formal presentations, provide expert advice or counselling, promote or sell products/services/ideas, resolve disputes, coach or mentor, facilitate meetings, deal with upset or angry people and gain the cooperation of others.

— The most important interpersonal skills revolve around patient health. It is frequently necessary to provide patients with information and tools needed to take responsibility of their own health care needs; however, it is also often necessary to intervene with other health care professionals on a patient’s behalf to obtain services for that patient. Skills related to health promotion and education may also be necessary. Communication skills are also required to relay the information obtained during the assessment of the patient to the appropriate physican in order to get an accurate diagnoses and treatment.

— Communications primarily occur with patients, the Regional Registered Nurse II responsible for the geographic area, and physicians. Communications may also occur with employees within the department and organization, management, students/trainees, internal executives, professional associations and professional advisors.

— The most significant contacts are with patients to discuss their health care needs, with physicians to discuss patient needs, and with the supervisor to discuss work needs.

### EFFORT

#### Physical Effort

— Occasionally, the demands of the job result in considerable fatigue requiring periods of rest and strength and endurance.
— Required to open valves on oxygen tanks requiring strength and to move people over 50 lbs. on stretchers.
— Physical effort also includes constantly sitting, standing and walking to work with patients.
Occasionally, works in awkward or cramped positions when in patients’ homes to perform wound care or other activities.

— When performing procedures, regularly uses fine finger/precision work (i.e. removal of foreign objects from eyes, ears and wounds).

**Concentration**

— **Visual concentration** is required when performing physical assessments. These assessments can take place at any time and anywhere. Frequently patients are seen at times and places where there is decreased lighting. When doing wound care some procedures can take a long time to perform but **visual alertness and concentration** must be maintained to observe for changes in the wound or the patient.

— **Auditory concentration** is required to monitor blood pressure which requires listening closely particularly if in a noisy environment such as during ferry transfers of a patient. **Auditory concentration** is also required when interacting with patients during assessments and to obtain a patient’s history.

— **Other sensory demands such as touch and smell** are required. Determining skin temperature around a wound is very important in assessing wound healing, and the smell of the drainage from a wound can provide a great deal of information. As well, smell from patients in general can give clues during a physical assessment (i.e. diabetic with sweet smelling breath, smell of alcohol on a patient, etc.).

— **Tasks that are repetitive requiring alertness** include working with patients who are experiencing acute illness or trauma and need to have their vitals monitored repeatedly. As generally the only health care professional available, care must be taken to be accurate in monitoring, particularly blood pressure and pulse.

— A **higher level of concentration and alertness** is required for the health of others. In emergency situations where non professionals have to be utilized to assist with the situation these people must be given clear and concise instructions so that they do not cause further injury to patient or themselves.

— Experiences **lack of control over the pace of work** when there are **time pressures and deadlines** due to emergencies or crisis situations, or when patients present with complex problems. Emergency situations can arise at any time (i.e. chest pain to motor vehicle accidents), and it may happen during regular working hours or during time off but it must be dealt with immediately. As well when attempting to contact physicians who may be involved with other activities and emergencies may have to wait depending on priorities at the physician level. As well, more than one emergency situation may arise at the same time and then priority must be given to the more life threatening situation.

— **Eye/hand coordination** is required in many work tasks, such as when doing wound care, removing foreign objects from eye or other body parts, inserting intravenous lines, venipuncture, and placement of EKG leads.

— **Exact results and precision** is required when removing foreign objects from eyes, ears or wounds and precision is needed to avoid damaging surrounding body parts.

**Complexity**

— Tasks and activities are quite different but allow for the use of similar skills and knowledge.

— Problems typically are different but related, are diverse and involve a wide variety of
responsibilities and situations, and are unique/multifunctional problems; however, work is performed within defined and standard work processes as per the nursing scope of practice. Occasionally, problems have limited or no guidelines or procedures for support, have limited opportunity for standardized solutions, may require creative problem definition and analysis and development of complex solutions.

— Due to the variety and complexity of problems/diagnoses and age groups, challenges/problems cannot be categorized as typical. Patients present with a wide variety of complaints/concerns that need to be addressed. Diagnoses of these concerns is usually in consultation with a physician or the Regional Registered Nurse II and treatment is arranged according to severity and priority.

— Complexities tend to be solved by contacting an on-call physician at the closest hospital, patient’s family physician, the Regional Registered Nurse II, or various management personnel depending on the nature of the problem (i.e. public health nurse manager, Continuing Care nurse manager, Patient Services Manager, and various Consultants are also available through telephone or e-mail in specific specialty area, i.e. wound care, reproductive health, nutrition, injury prevention and parent and child health). As well, updated organizational policy and procedures are located on the Intranet, and there are also ARNNL Standards of Practice available.

**RESPONSIBILITY**

**Accountability and Decision-Making**

— Work tasks and activities are generally not prescribed or controlled.

— Works independently in terms of patient assessment and treatment but has a Regional Registered Nurse II available, if required. Orders required medical, pharmacy and office supplies, and can decide to work overtime as patients are able to call the nurse at home and they are assessed via telephone or visit and the need for the patient to be seen is determined.

— Requires approval from the manager to purchase any new equipment for the clinic and to attend educational training sessions.

— Practically all work tasks require a high degree of independent discretion and judgement. The Regional Registered Nurse I either works alone in a remote community as a relief nurse, or works with a Regional Registered Nurse II with the main method of contact being via telephone to a physician. The nurse must determine when it is necessary to contact the physician and then through consultation determine what treatments are necessary for the patient.

**Impact**

— The Regional Registered Nurse I works as the single relief person in a clinic or along with a Regional Registered Nurse II; therefore, the work activities have a significant impact on patients, the immediate work area, and within the organization. Required to be on call 24 hours a day, anything can happen at any time, and situations must be dealt with as they arise. Tasks need to be given priority as they arise and completed depending on the priority they are assigned.

— Work activities impact on resources such as equipment, processes and systems, finances, facilities, material resources, human resources, corporate image, and health and safety.

— The work activities could negatively or positively impact on the quality of care provided to
patients and their families. Any errors made will be felt directly at the patient/nurse level as any mistakes would involve a health care patient.

— A medication error would be one of the most likely errors to occur. Other errors can be made in the diagnoses of a particular condition and either determining the wrong treatment or determining no treatment be given.

— Errors are typically identified by the nurse or the Regional Registered Nurse II and may have significant impacts on patient health.

**Development and Leadership of Others**

— Not responsible for the supervision of staff.

— May be required to provide development and leadership responsibilities such as on-the-job advice, guidance, direction, feedback to new employees, and some formal classroom training. In addition, may perform a project lead role during mass immunization clinic activities and other such activities when serving as a relief position.

**WORKING CONDITIONS**

**Environmental Working Conditions**

— Required to use protective cautions such as the wearing of gloves, masks, gowns, and to take preventative measures against the spread of diseases/infections through proper hand washing techniques.

— There is a limited likelihood of receiving minor cuts, bruises or acquiring minor illnesses (i.e. flu’s, chicken pox, stress, etc.), fracture or other injuries, and receiving a partial or total disability, if all safety precautions are undertaken.

— There is constant exposure to isolation, adverse weather conditions (on call 24 hours a day and may have to travel to a patient’s home), travel and sharp objects. There is regular exposure to bodily fluids/waste, infectious diseases, and odours. Occasionally, there is exposure to unusual distracting noise (when on ferry to transport patient and during clinic), dirt/dust/filth (in patient’s homes), glare, fumes, limited lighting, hazardous chemicals (some medications), toxic or poisonous substances, wet or slippery surfaces, and awkward or confining work spaces.
